PROFESSIONAL SUMMARY

Backend Engineer with nearly 2 years of professional experience building scalable, data-intensive backend systems. Strong hands-on experience with Java, Spring Boot, PostgreSQL, RabbitMQ, and Redis, with experience in database optimization, asynchronous processing, event-driven architecture, Docker, Kubernetes, and CI/CD.

TECHNICAL SKILLS

Languages: Java, SQL, JavaScript

Backend: Spring Boot, Spring Data JPA, Hibernate, Spring Security, REST APIs

Architecture: Microservices, Event-Driven Architecture, Asynchronous Processing, Multi-Tenancy, Caching

Databases & Messaging: PostgreSQL, Redis, RabbitMQ, MongoDB

DevOps & Cloud: Docker, Kubernetes, GitLab CI, ArgoCD, Oracle Cloud (OCI), Linux

Tools Maven, JUnit, Mockito, Git/GitHub, Postman, Swagger, Jira

WORK EXPERIENCE

Software Developer

Enterprise Bot, Bengaluru, India *September 2024 - Present*

- Independently architected and built **Pulse**, a multi-tenant analytics and quota-management platform used by partners, clients, and internal teams to monitor product usage, analyze team and environment performance, support usage-based billing, and automate quota notifications.
- Built a session-level pre-aggregation and batched backfill pipeline over datasets containing **400M+ raw events**, producing **7M+ consumption records** across more than five years of chat, voice, email, token, and LLM usage data.
- Reduced long-range PostgreSQL dashboard response time from approximately **14 seconds to under 1 second** through pre-aggregation, selective filtering, composite indexing, statistics tuning, and query-plan optimization.
- Designed asynchronous alert-processing workflows using scheduled workers, queue-based processing, retry handling, rule evaluation, and notification processing.
- Built asynchronous streaming CSV/ZIP export pipelines for **7M+ aggregated reporting records**, with progress tracking and object-storage delivery for large reporting workloads.
- Developed and optimized **15+ PostgreSQL analytics queries** powering conversation volume, engagement, and usage metrics using CTEs, window functions, composite indexes, EXPLAIN ANALYZE, statistics tuning, and selective JIT configuration.
- Containerized backend services with Docker and worked with Kubernetes, GitLab CI, and ArgoCD to build, deploy, and promote application changes across environments.

PROJECTS

AlertOps — Queue-Based Alerting & Escalation System *(Java, Spring Boot, PostgreSQL, RabbitMQ, Redis, JPA)* **GitHub**

- Built a backend-heavy alerting platform with JWT-based multi-tenant access, configurable alert flows, time-based escalations, and Redis-backed caching.
- Implemented optimistic locking using JPA entity versioning to detect concurrent workflow edits and prevent lost updates.
- Modeled alert workflows as configurable node-based flows, enabling flexible routing and extensibility over hard-coded logic.
- Engineered delayed alert escalation using RabbitMQ delayed queues, eliminating high-frequency cron polling and reducing database load.
- Designed restart-resilient, retry-safe escalation processing using at-least-once message delivery and idempotent consumers, reducing the risk of missed escalations during failures or restarts.

EDUCATION

Arya College of Engineering & IT

Jaipur, India

B.Tech in Computer Science & Engineering *Sep 2020 - May 2024*

CERTIFICATIONS

- Red Hat Certified System Administrator (RHCSA) — 284 / 300
